

IN THE CLAIMS:

Please amend the claims as follows:

1. (Currently Amended) A connectors-integrated directional coupler comprising:
a cylindrical housing having an input connector integrally extended from one end of the housing and an output connector integrally extended from the other end of the housing;
a main line having a main bar and sub bars integrally extending from both ends of the main bar so that the main line connects the input connector to the output connector for delivering a signal;
a coupling plate mounted on an outer circumferential surface of the housing;
an elongated hole extending from the input connector to the output connector for accommodating the main line therein; and
a coupling line formed on the coupling plate for inducing the signal from the main line thereto; wherein the housing, the input connector, and the output connector are arranged coaxially
2. (Original) The connectors-integrated directional coupler of claim 1, wherein the coupling line comprises a coupling port at one end thereof for outputting power induced from the main line.
3. (Cancelled).
4. (Currently Amended) The connectors-integrated directional coupler of claim 13, wherein the housing further comprises a planar mounting surface having at least two coupling holes at an outer circumferential surface of the housing for mounting the coupling line thereon.
5. (Original) The connectors-integrated directional coupler of claim 1, wherein the coupling line is a microstrip line.
6. (Original) The connectors-integrated directional coupler of claim 1, wherein the main line comprises:
a main bar; and

sub-bars integrally extending from both ends of the main bar.

7. (Original) The connectors-integrated directional coupler of claim 2, further comprising a planar cover having a port hole from which the coupling port protrudes for covering a top surface of the coupling line and closely fixing the coupling line to the housing.

8. (Original) The connectors-integrated directional coupler of claim 1, further comprising:
a fixing groove formed to a predetermined depth on the outer circumferential surface of the output connector;

a fixing ring fit around the fixing groove, protruding to a predetermined height from the outer circumferential surface of the first connector; and

a hollow cover opened at both ends thereof and engaged with the first connector so that the hollow cover is rotatable around the first connector.

9. (Original) The connectors-integrated directional coupler of claim 8, wherein the hollow cover comprises screw threads formed on the inner circumferential surface thereof to allow the hollow cover to be engaged with an external signal line.

10. (Original) The connectors-integrated directional coupler of claim 1, wherein the input connector comprises screw threads formed on the outer circumferential surface thereof.

11. (Original) The connectors-integrated directional coupler of claim 1, further comprising one or more Teflon support members fixed in the elongated hole of the housing, spaced from each other by a predetermined distance.

12. (Original) The connectors-integrated directional coupler of claim 11, wherein the Teflon support members provide an electrical isolation between the housing and the main line.

13. (Original) The connectors-integrated directional coupler of claim 11, wherein each of the Teflon support members having a through hole formed coaxially with the elongated hole of the

housing to allow the main line to extend therethrough.

14. (Original) The connectors-integrated directional coupler of claim 11, wherein a plurality of the Teflon support members is formed on the inner wall of the through hole of the housing to determine the positions of the Teflon support members.

15. (Original) The connectors-integrated directional coupler of claim 11, wherein one of the Teflon support members is spaced from the end of the input connector by a predetermined distance.

16. (Original) The connectors-integrated directional coupler of claim 11, further comprising a support member holder, the support member holder including:

a holder fixed to the end of the output connector for preventing the Teflon support member from being out of place from the elongated hole of the housing;

a guide extending from the holder toward the end of the output connector; and

a guide hole penetrating the holder and an end of the guide for exposing the main line therefrom.

17. (Original) The connectors-integrated directional coupler of claim 15, further comprising a gasket attached to one end of the holder, covering the outer circumferential surface of the guide and extending in a diameter direction of the guide.

18. (Cancelled)
